PREDICTING DUNE EROSION WITH COMBINED PROCESS-BASED AND MULTIVARIATE STATISTICAL MODELS

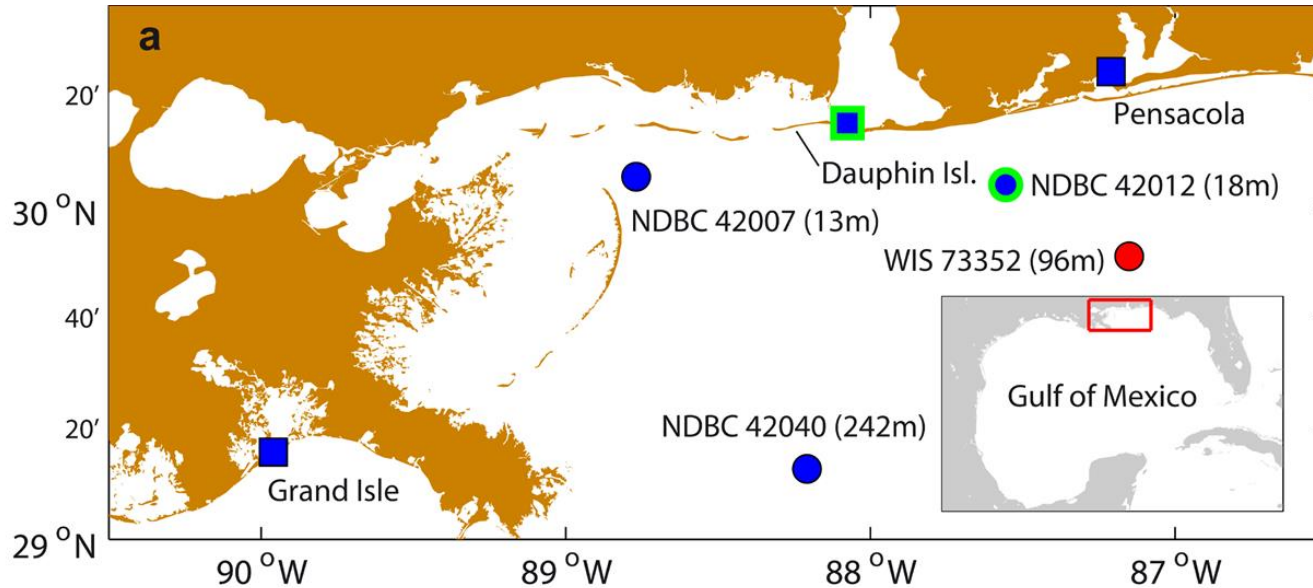

Credit: USGS

Passeri, Joseph Long,
Nathaniel Plant*

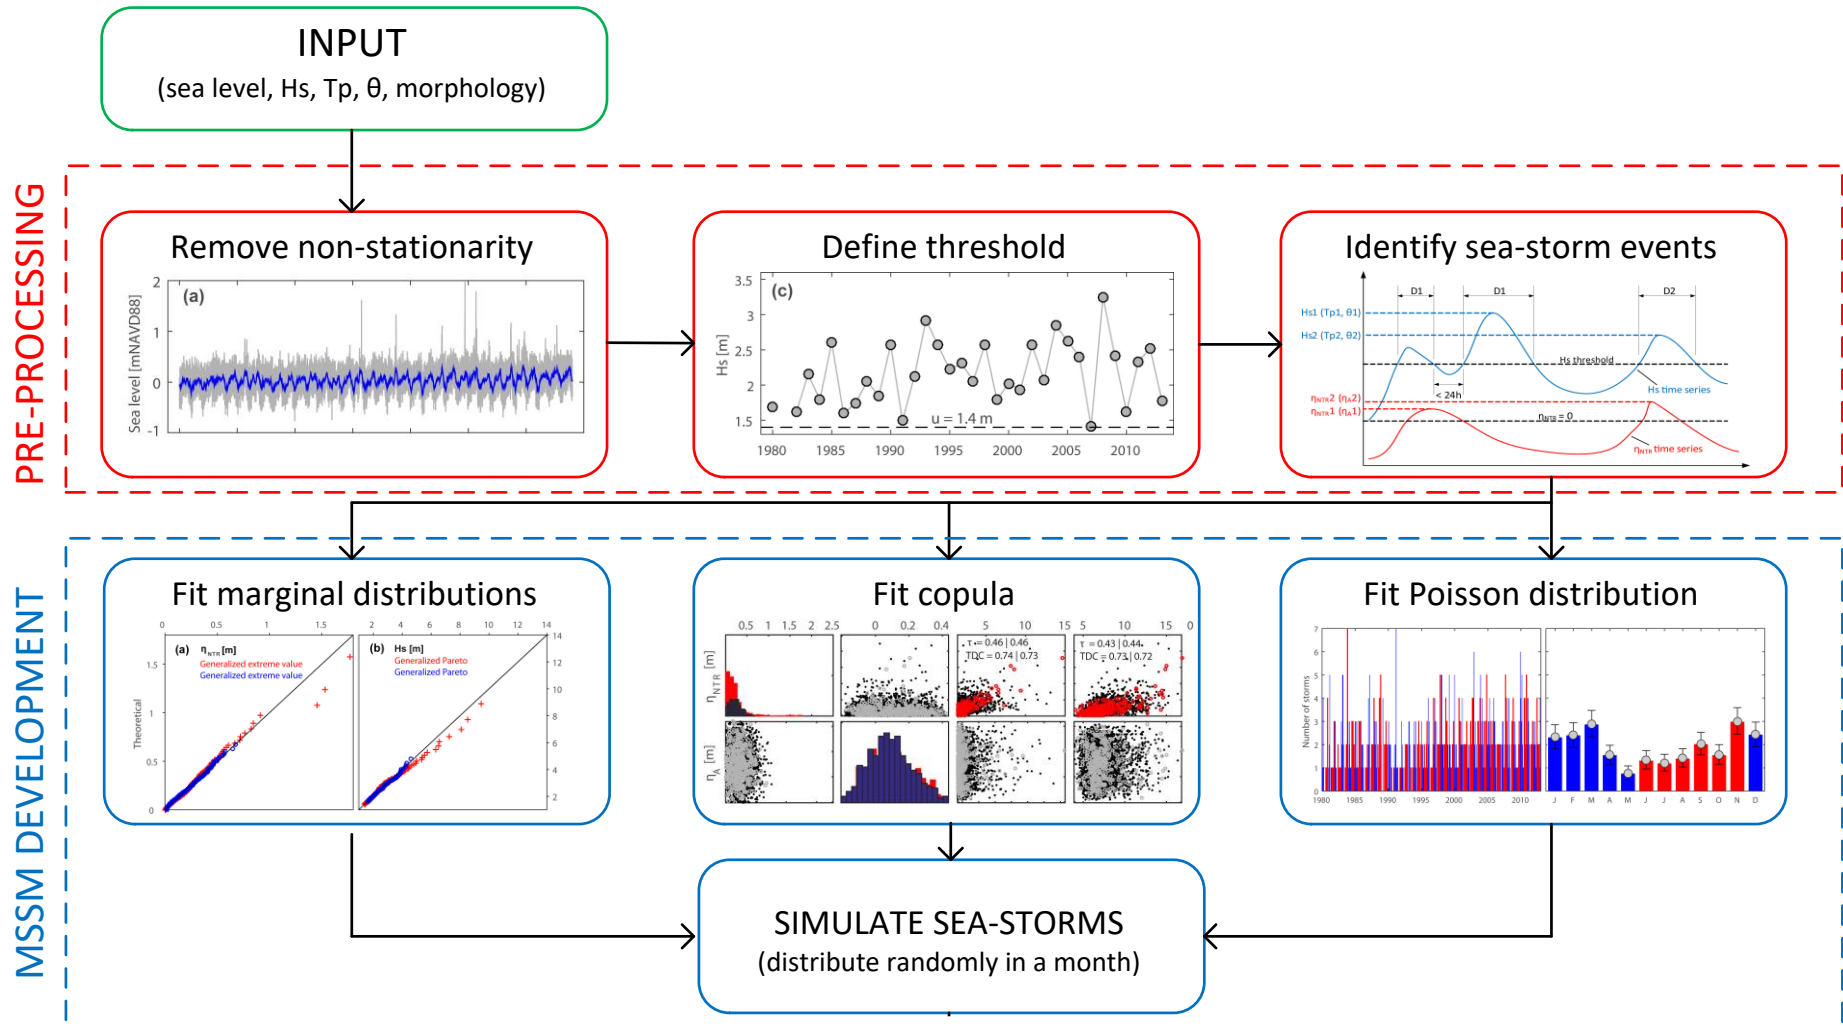

Motivation

- Dune erosion during extreme events leaves coastal communities vulnerable to flooding
- Ensemble forecasting systems for storm surges and waves are widely applied
- Translating the information into dune response is hampered by high computational cost of numerical models (e.g. XBeach)
- Our goal is to develop and test surrogate models to mimic XBeach, but at very low computational cost

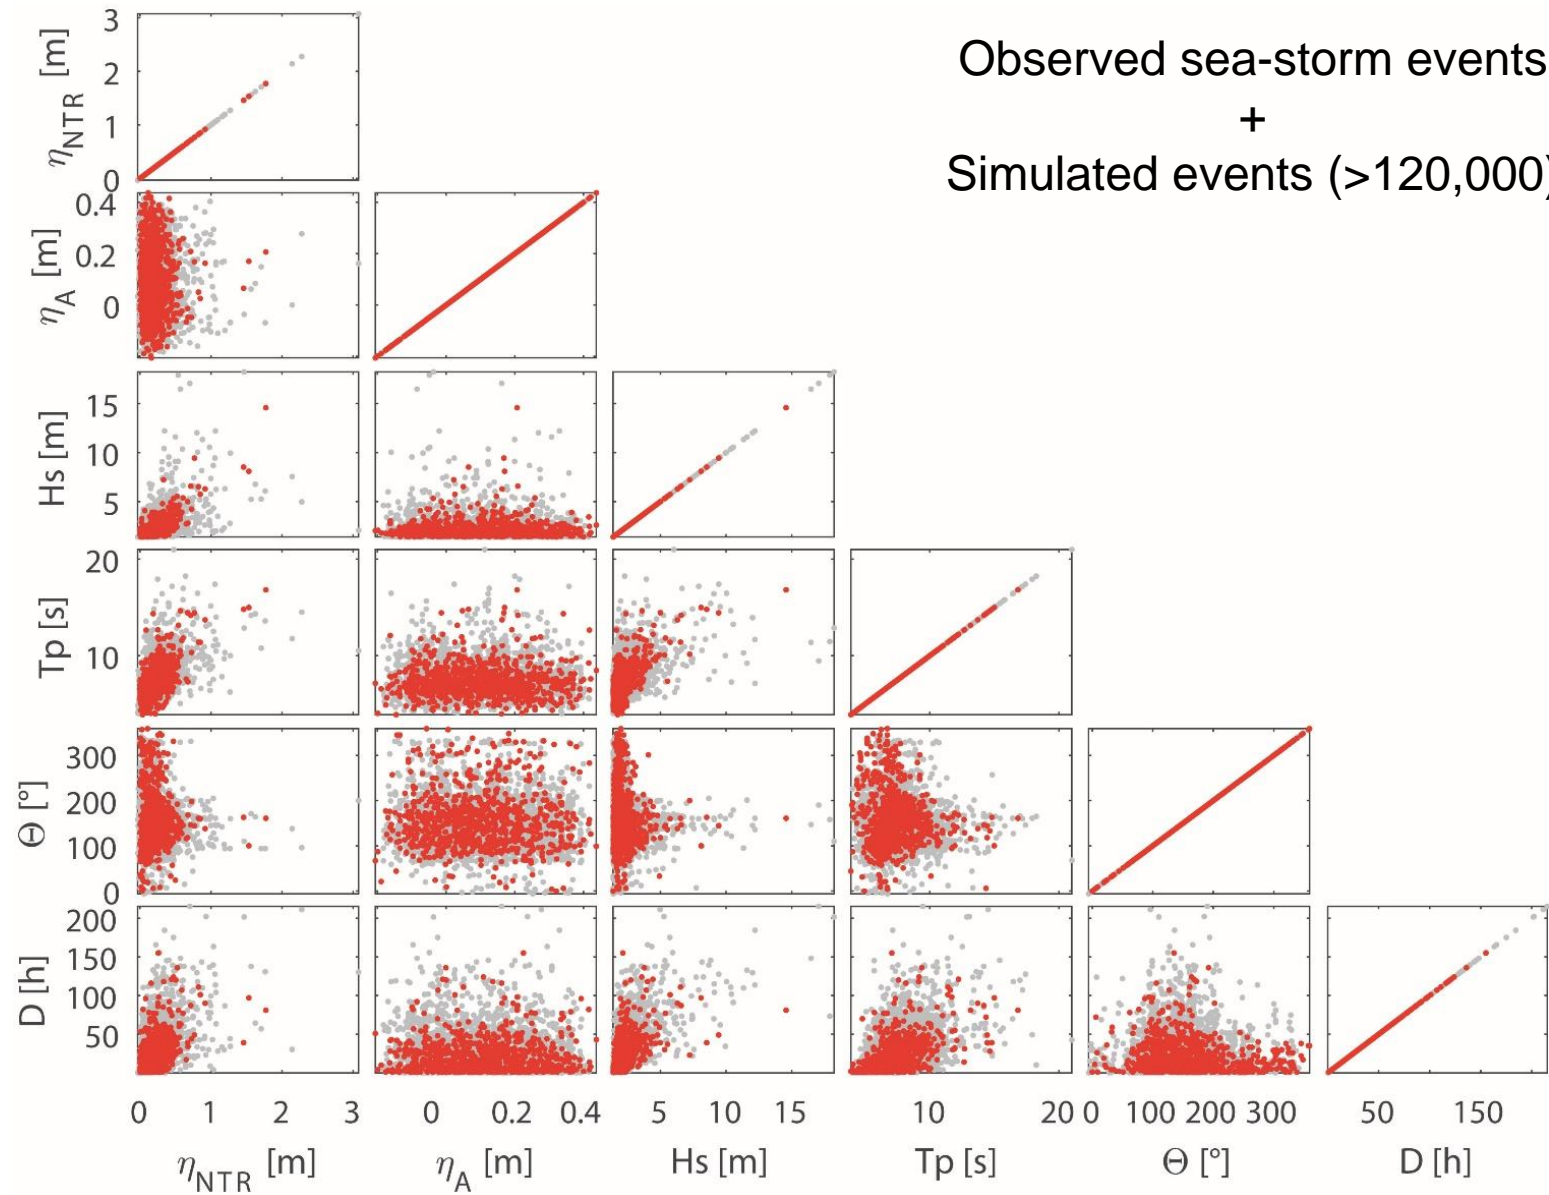

Continuous **34-year** long records of hourly sea level (tide η_A + surge η_{NTR}), significant wave height H_s , wave peak period T_p , wave direction Θ .

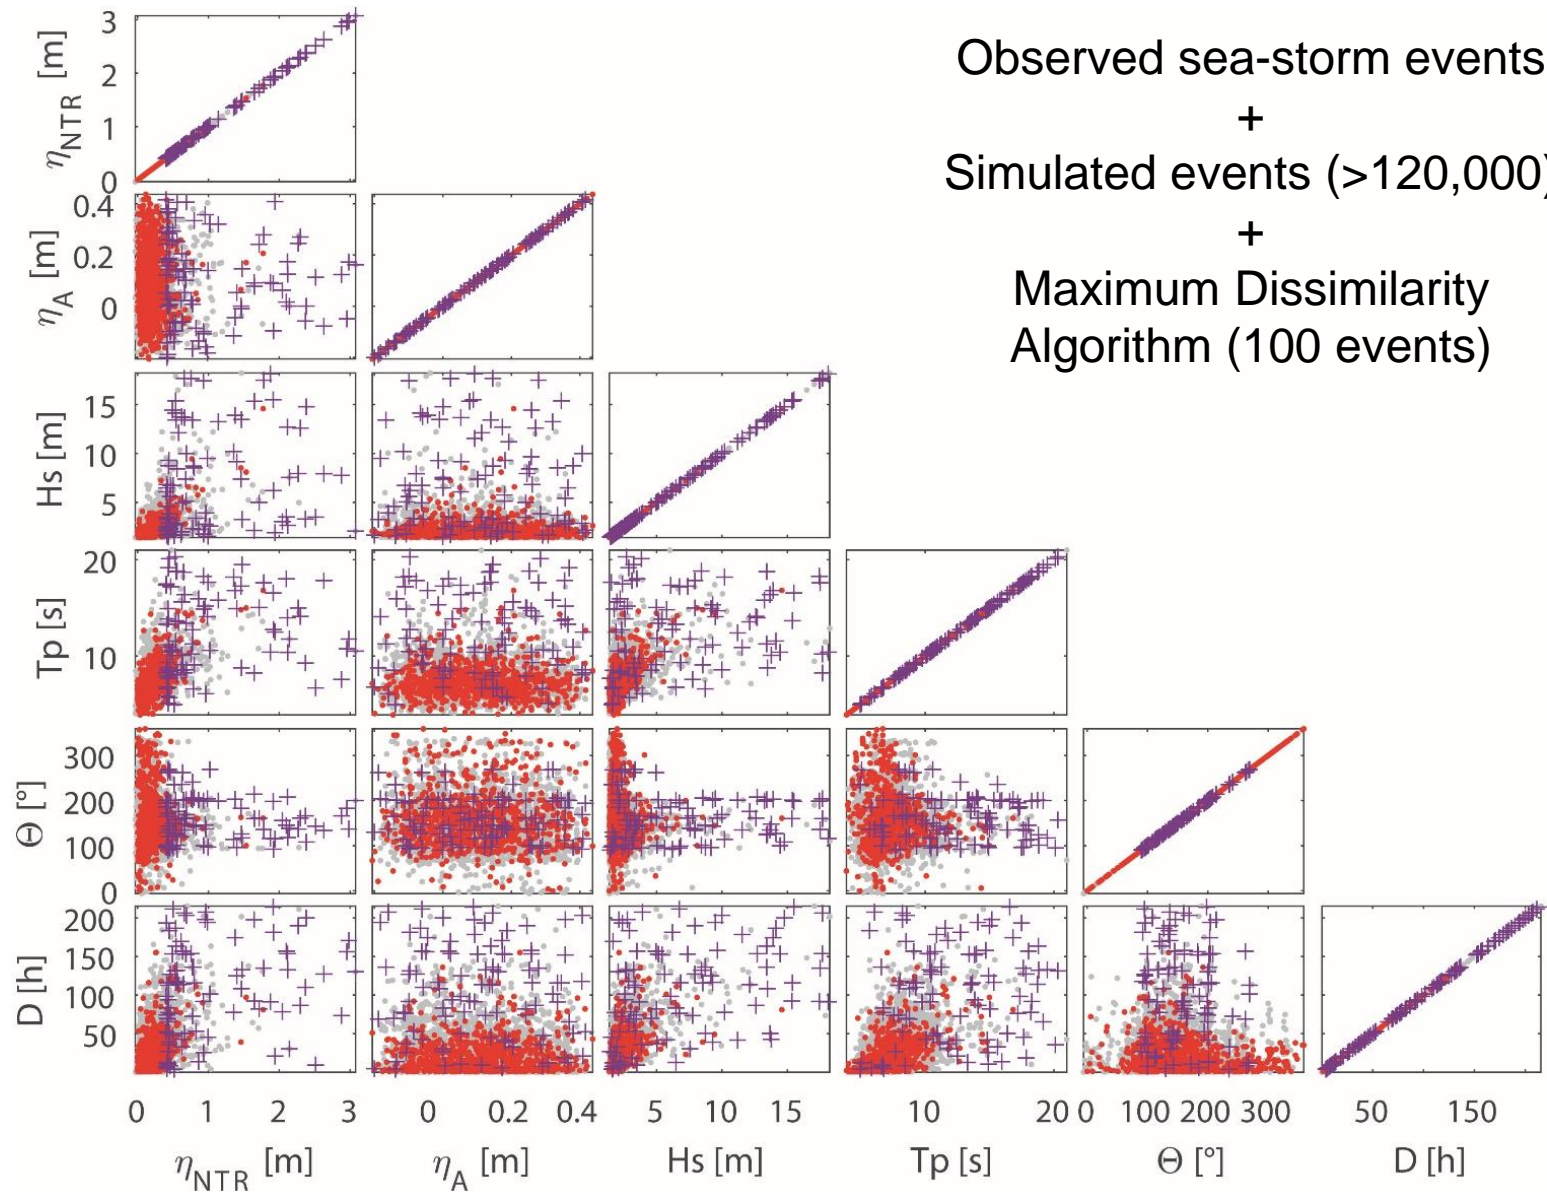

Investigation area

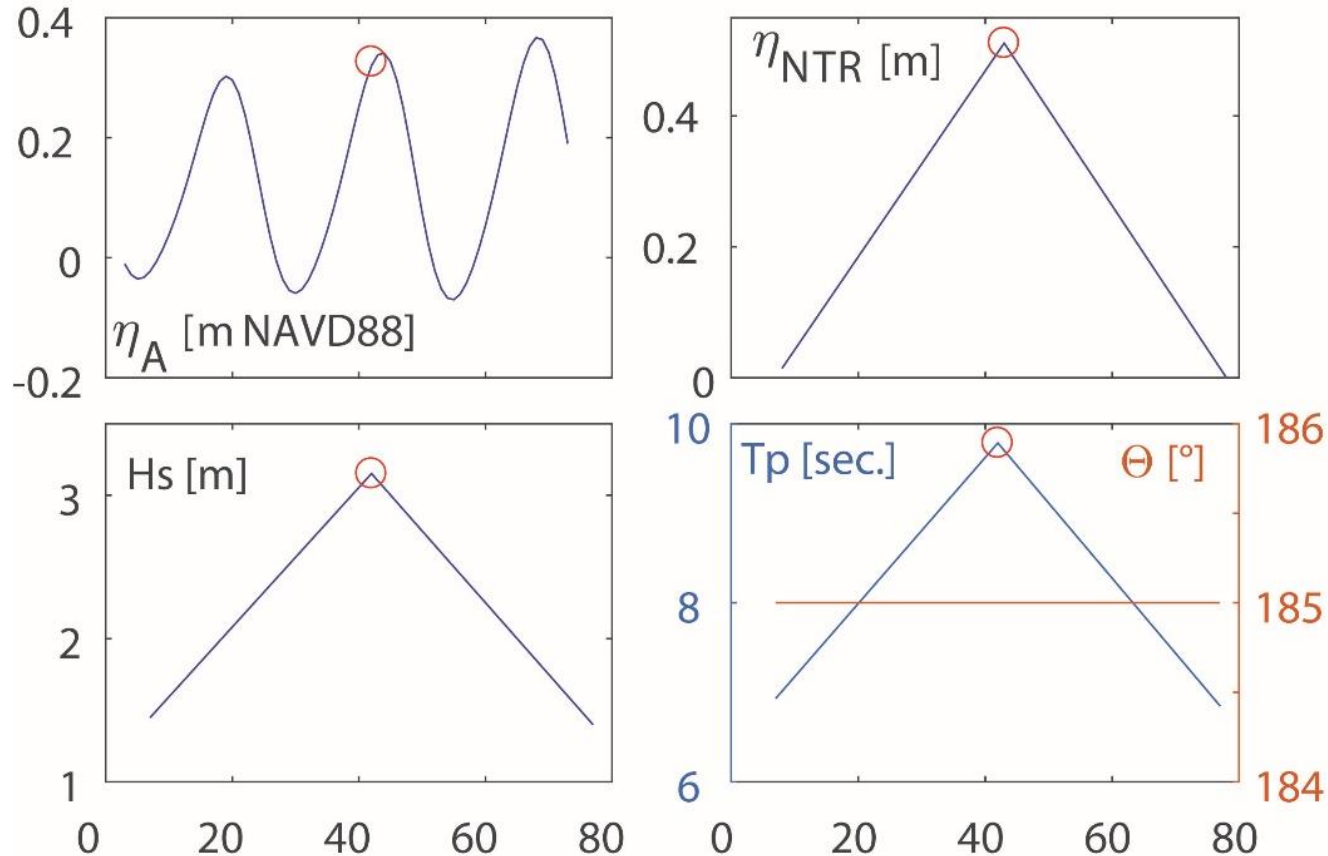

Sea storm simulation

XBeach

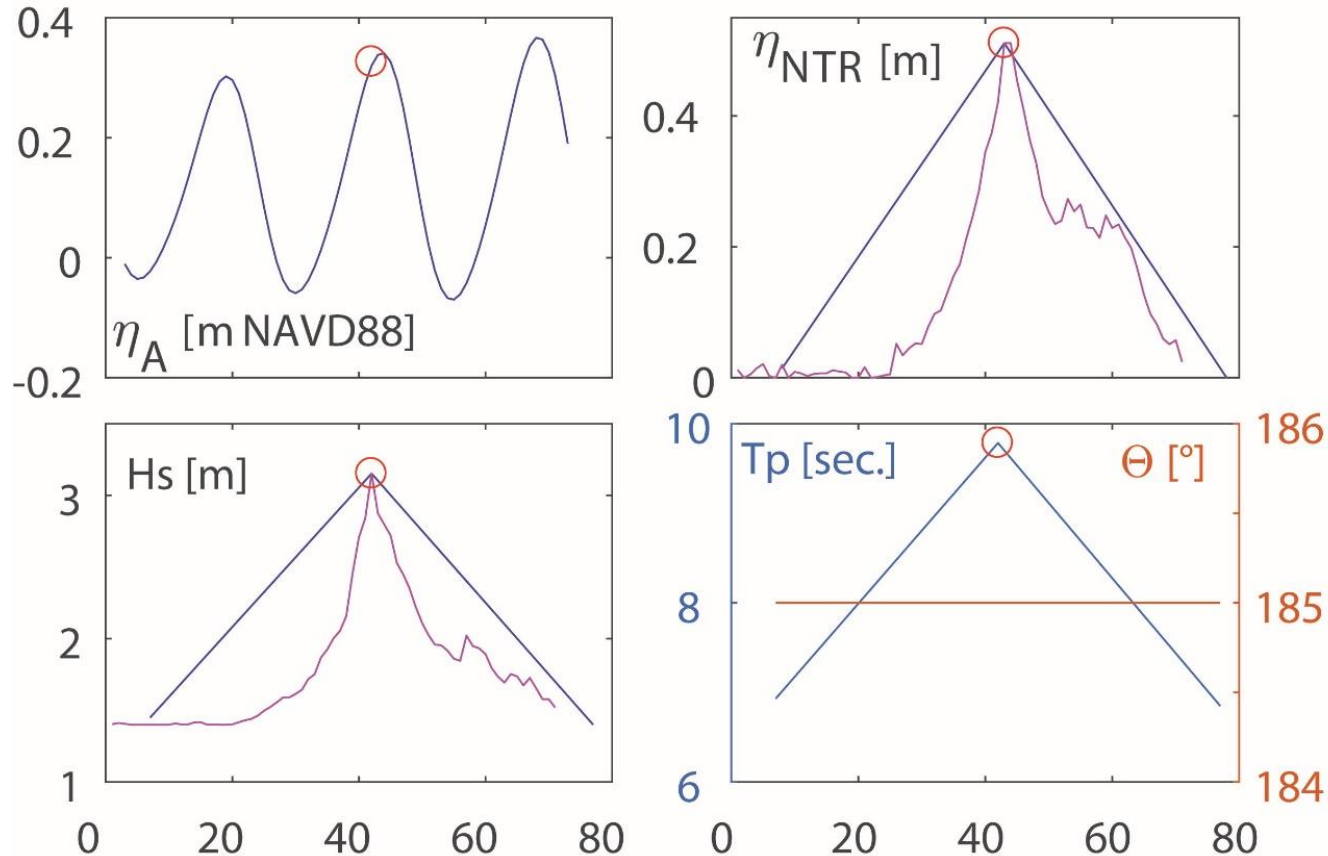

Surrogate models

- Point estimates need to be transformed to continuous time series for XBeach simulations
- Surge, wave height and wave period are parameterized as triangular for extra-tropical events

- Point estimates need to be transformed to continuous time series for XBeach simulations
- Surge, wave height and wave period are parameterized as triangular for extra-tropical events
- “Representative” curves are used for surge and wave height for tropical events

Sea-storm variables → Simulator

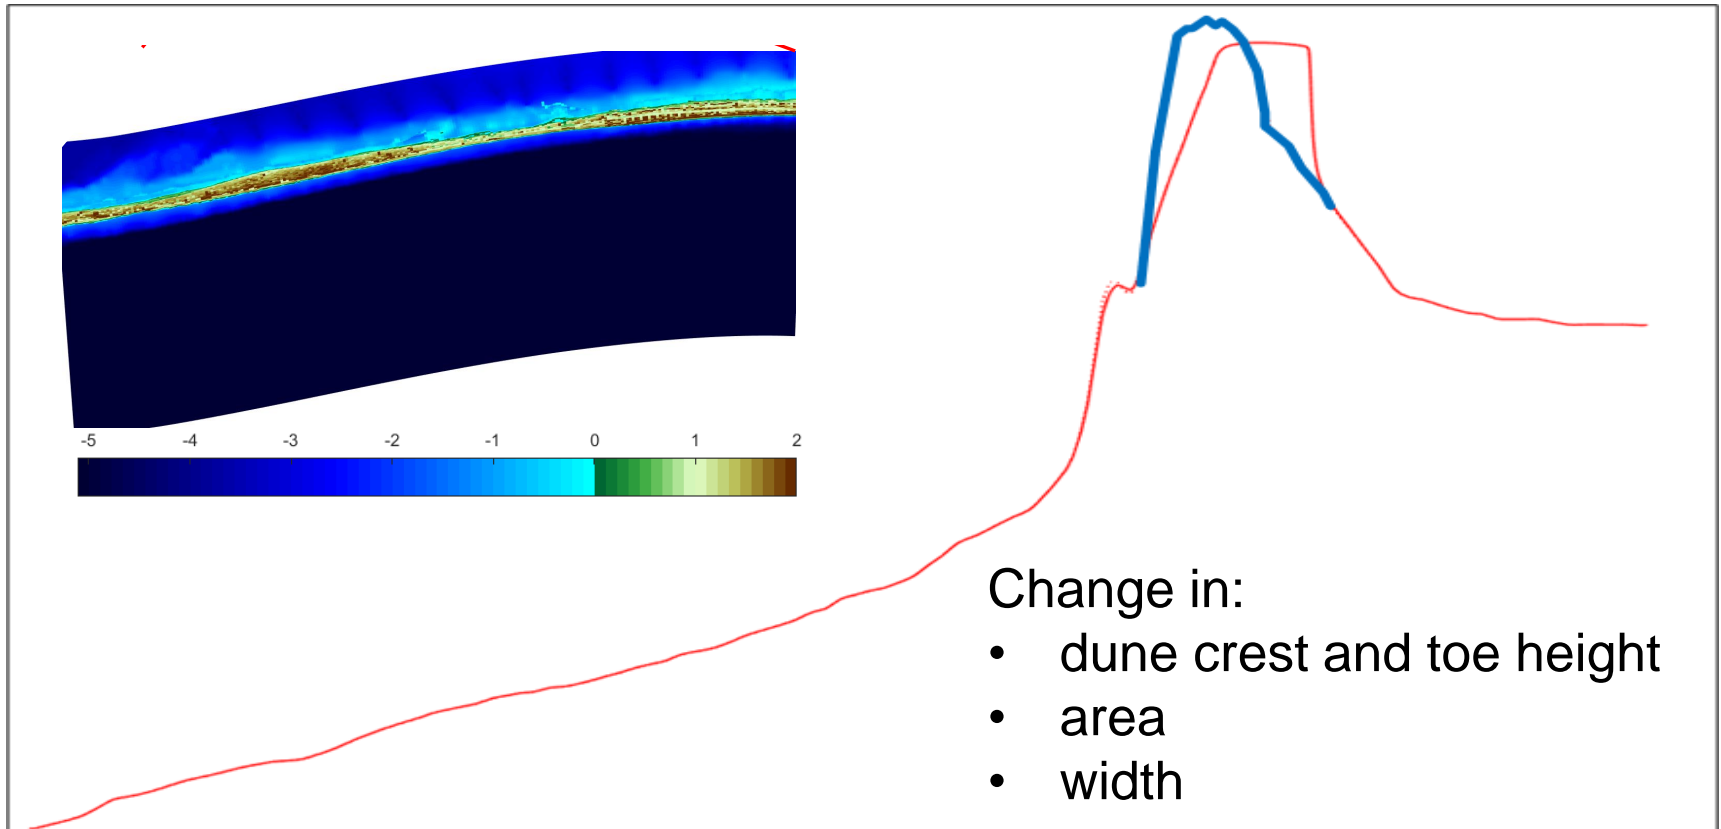

Cross-shore resolution:
2.5m (nearshore) – 12m
(offshore)

Alongshore resolution: 50m

Elevation: compilation of
pre-Ivan topo/bathy

Passeri et al. (2018) The influence of bed friction variability due to land cover on storm-driven barrier island morphodynamics, *Coast. Eng.* 132, 82-94.

Sea-storm variables → Simulator → Structural variable(s)

Investigation area

Sea storm simulation

XBeach

Surrogate models

Sea-storm variables

Simulator

Structural variable(s)

- Change in:
- dune crest and toe height
 - area and width
 - cross-shore location

Surrogate models:

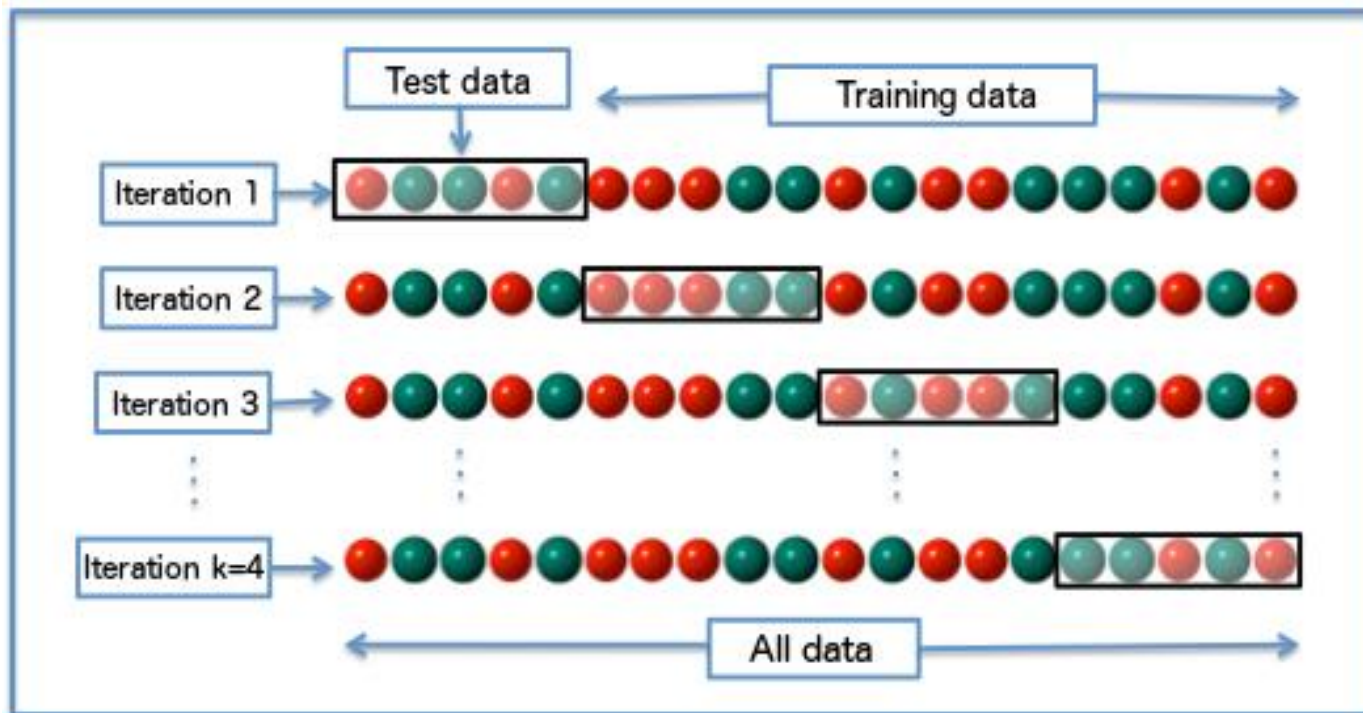

Multiple linear regression (MLRM)

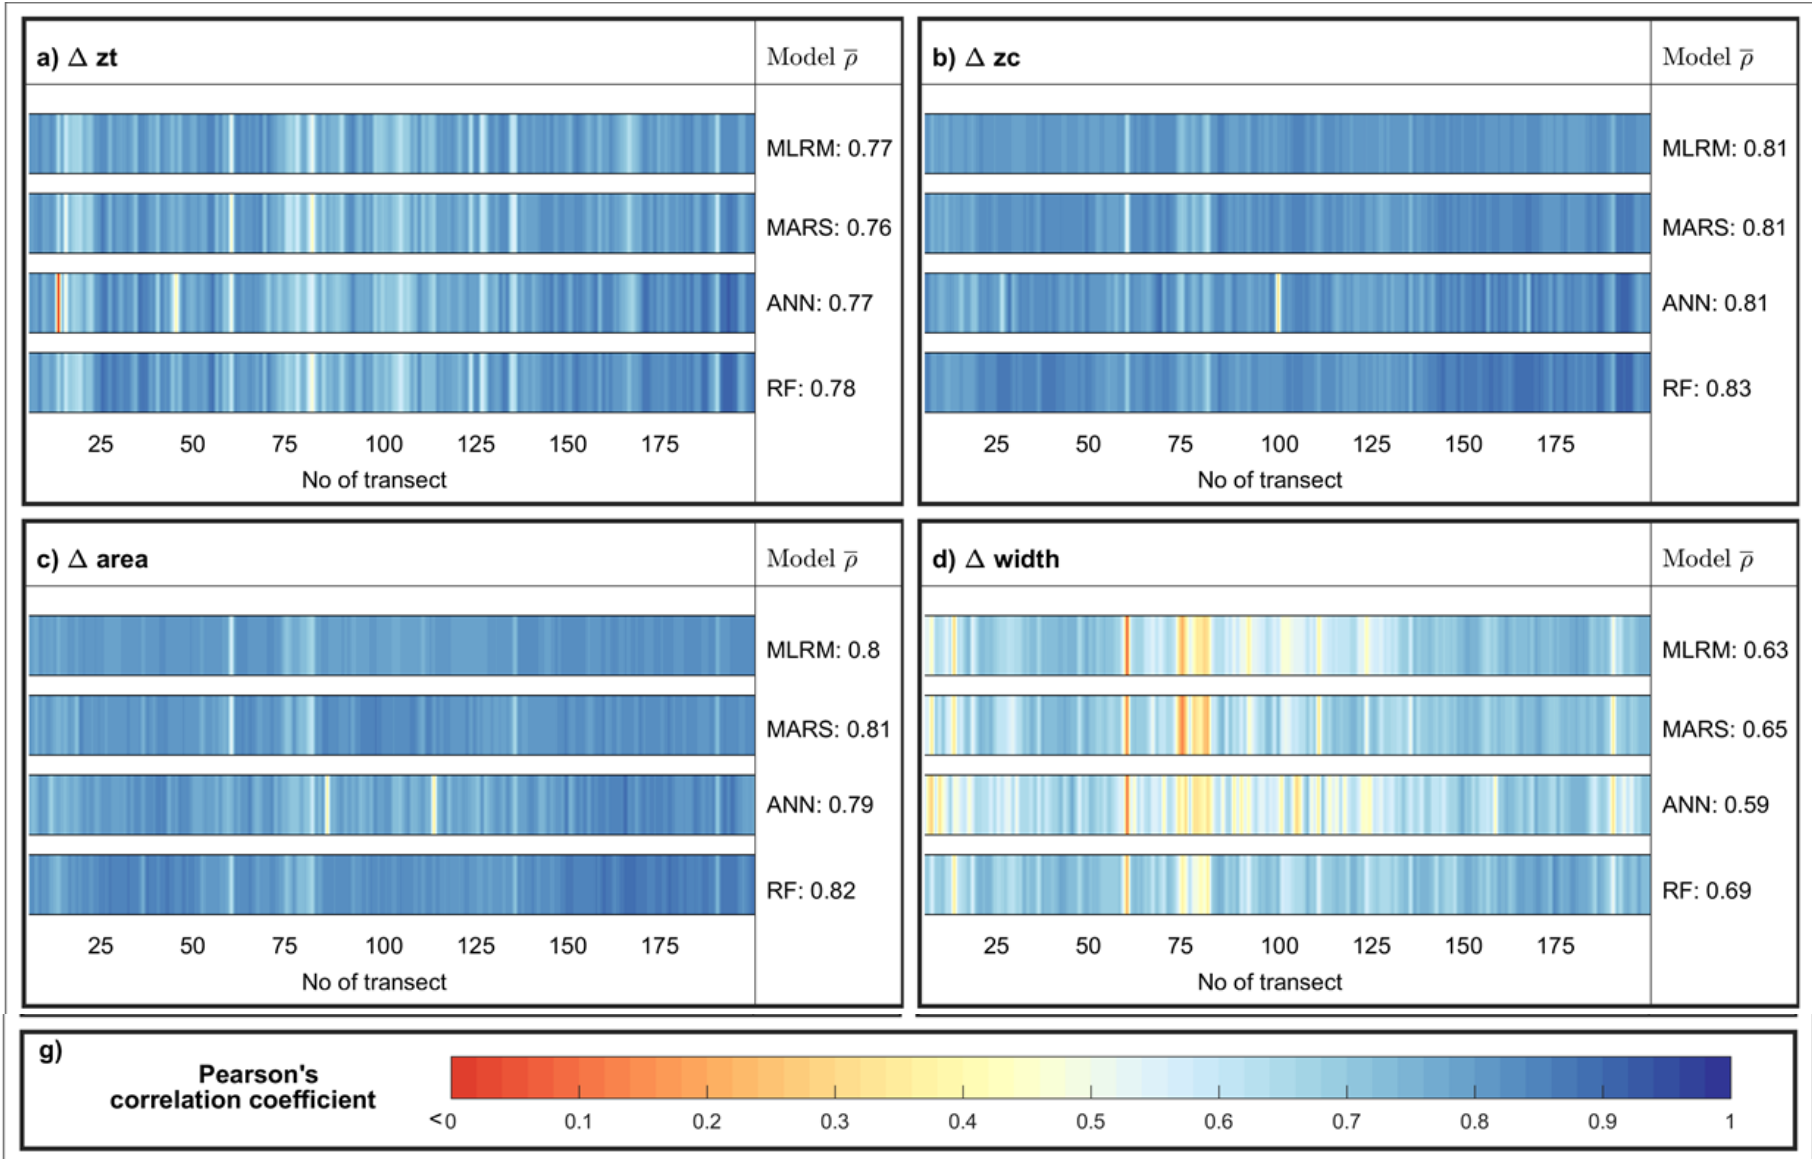

Artificial Neural Networks (ANN)

Multivariate Adaptive Regression Splines (MARS)

Random Forests (RF)

- Surrogate models are trained based on oceanographic drivers (predictors) and dune response (predictand)
- K-fold cross validation is performed (for different values of k)
- Performance indicators: Pearson correlation coefficient and root mean squared error

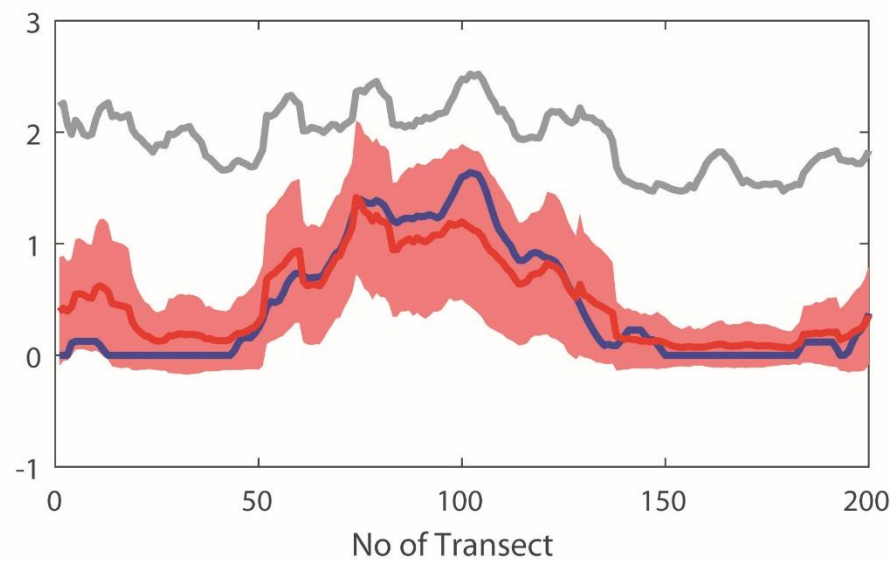

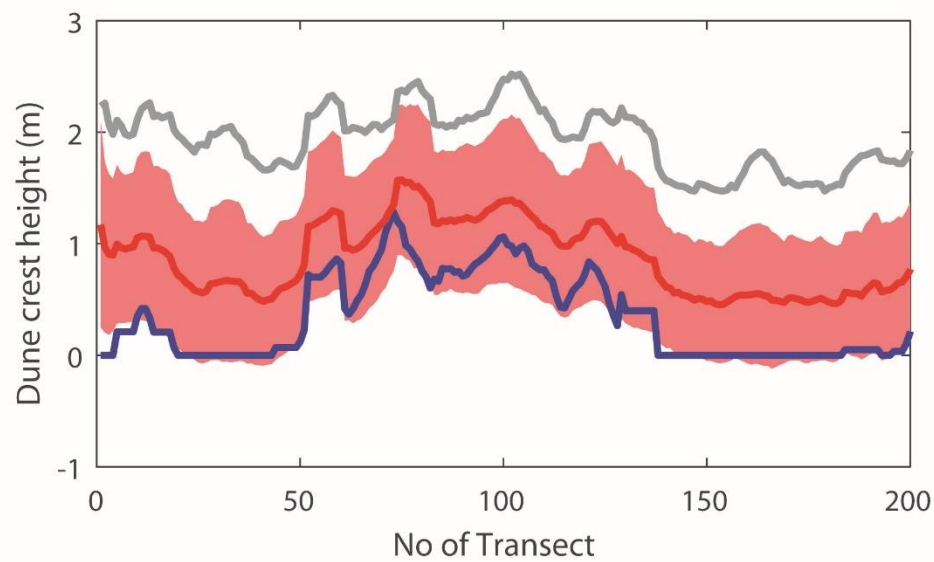

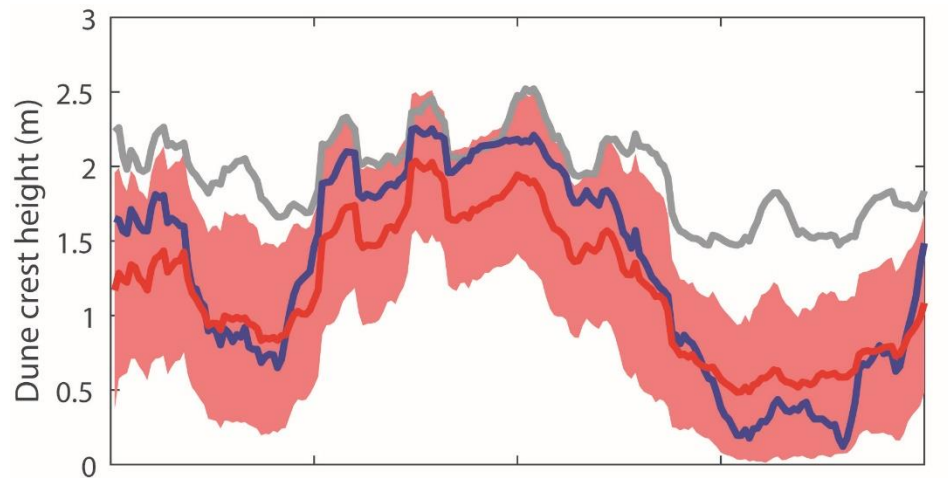

Investigation area

Sea storm simulation

XBeach

Surrogate models

The background image is a faded, sepia-toned photograph of a beach. On the left, a small white house with a gabled roof sits atop a sand dune. To the right, a large, complex wooden structure, possibly a lifeguard stand or observation tower, is built on the dune. In the foreground, three people are standing on the sand, looking towards the structure. The overall scene is hazy and lacks sharp detail due to the fading effect.

**Thank you for your
attention!**
